COVER LETTER

Dear hiring team,

I have 3+ years of focused trading experience in NQ futures, including multiple payouts from futures prop firms in the last year. To automate what works, I have spent the past year building a modular quantitative trading framework from scratch. My main focus has been preventing overfitting, and building this system taught me firsthand that the difference between a theoretical strategy and one that actually survives the market is entirely in the engineering underneath it.

Since September 2025, I have been running my own capital through this system, trading four uncorrelated strategies across different assets and timeframes for maximum diversification. I built a strict object oriented architecture to be able to easily add more features, structured as discrete layers: a data layer with multiple persistent storage backends, a cache layer on the hot paths for maximum performance with support for memory and Redis, a broker layer behind a unified API, an optimisation layer, real time risk management, and a notification and communication layer for live alerts.

Because execution speed and throughput are critical, I am deeply focused on micro performance optimizations. The system is designed to be highly concurrent, heavily utilizing multi processing and threading to ensure the pipeline never bottlenecks. For position scoring, the engine leverages PyTorch, backed by strict walk forward cross validation, Monte Carlo analysis, and automated risk management.

Alongside my trading engine, I bring four years of experience in C++, Python, SQL, TypeScript, React, Next.js, Tailwind, and WordPress. Whether I am shipping websites in my current role at Nobears Rotterdam or building firmware to dashboard stacks at my previous IoT startup, I am highly comfortable with complex exchange APIs, latency sensitive code, and owning a project end to end.

The combination of my trading experience, trading bot, professional experience and the ability to learn very quickly positions me perfectly to collaborate across your teams. I would welcome the chance to talk about how I can contribute to the team. My code and projects can be found at <https://sadra.nl> and <https://github.com/SadraShameli>.

Kind regards,
Sadra Shameli
